

MEETING_TRANSCRIPT_1.txt

Meeting ID: DISC-001

Meeting Title: PullUp Initial Founder Discussion & Technical Introduction

Date: 04 April 2026

Time: 5:00 PM – 6:25 PM

Location: Atlas Campus

Participants:

- Krish (Founder)
- Rhythm (Prospective Technical Team)
- Developer Candidate 2

Transcript Source: Generated from meeting recording using speech-to-text software.

Classification: Discussion

Status: Informational

[00:00:08]

Krish:

Yeah, so thanks for coming. Aneesh sir told me you guys might be interested, so I just wanted to explain what I'm building and where the project currently stands.

[00:00:25]

Rhythm:

Yeah sure. We'd love to understand the project first.

[00:00:42]

Krish:

Basically I'm building a startup called PullUp.

Right now the focus is Atlas students only.

The idea came because every single day after college people are literally going to the same places but travelling separately.

Someone is paying seven hundred rupees to go to Thane.

Another guy is paying six hundred and fifty.

Someone else is paying eight hundred.

And nobody knows they're all going to the same area.

[00:01:31]

Krish:

I realised there should be a way for students to connect before booking transportation.

Not exactly a ride-sharing app.

More like a ride coordination platform.

[00:01:55]

Developer Candidate:

So kind of like Uber Pool?

[00:02:03]

Krish:

Sort of.

But we're not becoming Uber.

We're not providing drivers.

We're not providing vehicles.

We're not booking taxis ourselves.

At least not right now.

[00:02:22]

Krish:

Think of it as a student transportation network.

[00:02:38]

Rhythm:

How far along is the project currently?

[00:02:45]

Krish:

UI is basically done.

I've already hired a developer.

He's from another college.

He was a mutual contact.

He's working on React Native.

Backend is Firebase.

I think within a week or two most of the backend should be complete.

[00:03:18]

Rhythm:

Then what exactly are you looking for from us?

[00:03:24]

Krish:

Honestly?

Trust.

[00:03:31]

[Laughter]

[00:03:38]

Krish:

No seriously.

The developer is good.

But he's not from Atlas.

I don't see him every day.

Everything is currently in his hands.

Code.

Backend.

Firebase.

Deployment.

Everything.

That makes me uncomfortable.

[00:04:12]

Krish:

I want people on campus who understand the project.

Who can look at the code.

Who can continue development.

Who can help me scale it.

Who can tell me if something is wrong.

[00:04:45]

Rhythm:

Makes sense.

So currently what features exist?

[00:04:56]

Krish:

Login.

Profiles.

Ride posting.

Ride discovery.

Basic notifications.

Maps.

Those are the main things.

[00:05:23]

Krish:

But honestly I think the bigger opportunity is taxi pooling.

[00:05:39]

Rhythm:

Taxi pooling?

[00:05:46]

Krish:

Yeah.

Imagine four Atlas students leaving college at six.

All heading towards Thane.

Why should they all book separate Ubers?

[00:06:09]

Krish:

The app should find those people.

Put them together.

Create a temporary group.

Then one person books the cab.

Everyone travels together.

Everyone splits the fare.

[00:06:35]

Developer Candidate:

That sounds more useful than simple ride discovery.

[00:06:43]

Krish:

Exactly.

That's why I'm seriously considering making Taxi Pool the main feature.

[00:07:15]

Rhythm:

How would matching work?

Exact destination?

[00:07:29]

Krish:

That's one thing I'm not sure about.

Initially I thought exact destination.

But then I realised nobody will match.

[00:07:46]

Krish:

For example.

One student enters Viviana Mall.

One enters Hiranandani Estate.

One enters Teen Hath Naka.

Technically those are different places.

But realistically they're all going to Thane.

[00:08:14]

Krish:

So I think we need clusters.

Thane.

Navi Mumbai.

Western Line.

Central Line.

Something like that.

[00:08:44]

Rhythm:

Yeah destination clustering would probably increase match rates significantly.

[00:09:02]

Krish:

Exactly.

I don't care about perfect matching.

I care about useful matching.

[00:09:34]

Developer Candidate:

What about scalability?

[00:09:41]

Krish:

That's actually something I wanted to ask you guys.

Because we're using Firebase.

[00:09:57]

Krish:

I've heard Firebase is great initially.

But I don't know what happens if we suddenly have a few thousand users.

[00:10:21]

Rhythm:

Depends on database design.

Reads and listeners can become expensive.

[00:10:38]

Krish:

Yeah that's what worries me.

I don't want a situation where the app starts growing and suddenly costs explode.

[00:11:05]

Krish:

I'd rather spend more time designing properly now.

[00:11:32]

Rhythm:

Have you thought about monetization?

[00:11:45]

Krish:

A little.

Not immediately.

But eventually yes.

[00:11:58]

Krish:

I think there are opportunities with student-focused ads.

Restaurants.

Cafes.

Hostels.

Events.

Things like that.

[00:12:29]

Krish:

But honestly.

If the app doesn't solve transportation first.

Nothing else matters.

[00:13:01]

Developer Candidate:

What are your plans beyond Atlas?

[00:13:16]

Krish:

If it works here.

Then every college has the same problem.

NMIMS.

Mithibai.

SPIT.

Everywhere.

[00:13:44]

Krish:

But I don't want to think about ten colleges right now.

First make Atlas work.

[00:14:12]

Rhythm:

Fair.

[00:14:29]

Krish:

The main reason I wanted this meeting is because I need technical people around me who understand the product.

Not just people who write code.

People who understand why we're building it.

[00:15:07]

Krish:

Because features will change.

The product will evolve.

The original idea has already changed twice.

[00:15:36]

Krish:

And I think Taxi Pool might become the biggest thing in the app.

[00:16:04]

Meeting Ends

Summary Extracted From Transcript

Key Topics Discussed:

1. PullUp Startup Introduction
2. Atlas Student Transportation Problem
3. Existing React Native + Firebase Architecture
4. Dependency Risk On Current Developer
5. Taxi Pool Feature Proposal
6. Destination Clustering Concept
7. Firebase Scalability Concerns
8. Future Monetization Possibilities
9. Multi-Campus Expansion Vision
10. Need For Local Technical Team

Key Decisions:

- Continue with React Native
- Continue with Firebase
- Explore Taxi Pool implementation
- Investigate destination clustering
- Review Firebase scalability before launch

Action Items:

A1: Review existing codebase

A2: Understand Firebase architecture

A3: Evaluate Taxi Pool feasibility

A4: Estimate development effort

A5: Prepare technical recommendations
