

REQUIREMENT SPECIFICATION DOCUMENT – VERSION 1

Project Name

PullUp

Project ID

PULLUP-ATL-2026

Document Version

1.0

Document Type

Initial Product Requirement & Business Context Document

Prepared By

Founder & Product Team

Date

April 2026

Classification

Internal Use Only

1. Executive Summary

PullUp is a campus-exclusive mobility platform designed to solve a common transportation problem faced by students.

Many students commute to and from campus every day. Although a large number of students travel to similar destinations, they currently travel independently and often bear the full transportation cost themselves.

The objective of PullUp is to create a trusted student transportation network where students can discover others traveling in similar directions, coordinate transportation, reduce travel expenses, and improve commuting convenience.

The first release of PullUp will be limited to Atlas students only.

The long-term vision is to establish PullUp as the default student transportation ecosystem that can eventually expand across multiple universities.

2. Business Problem Statement

During informal discussions with students, several transportation challenges were repeatedly identified.

Students reported:

- High transportation costs.
- Difficulty finding trustworthy co-passengers.
- Lack of visibility into who is traveling to similar destinations.
- Dependence on expensive solo cab rides.
- Safety concerns during late evening travel.

Currently there is no centralized system that helps students coordinate transportation with other students.

As a result:

- Transportation costs remain high.
- Ride occupancy remains inefficient.
- Students lose opportunities to save money.
- Students travel alone even when multiple students are heading to the same area.

The founder believes that a university environment naturally creates transportation clusters and that technology can be used to connect these users efficiently.

3. Product Vision

The vision of PullUp is to create a transportation coordination network exclusively for students.

The platform should:

- Connect students travelling in similar directions.
- Reduce transportation expenses.
- Increase ride occupancy.
- Improve convenience.

- Improve safety through verified identities.

The platform should become the first application a student opens when planning transportation from campus.

The application should eventually support:

- Ride sharing
- Taxi pooling
- Event transportation
- Student transportation communities
- Transportation analytics

However, the initial version will focus only on ride discovery and coordination.

4. Project Goals

The primary goals of Version 1 are:

Goal 1

Provide a verified student-only platform.

Goal 2

Allow students to create transportation requests.

Goal 3

Allow students to discover other students travelling to similar destinations.

Goal 4

Enable communication between interested students.

Goal 5

Establish the technical foundation required for future pooling features.

5. Target Users

Primary Users

Atlas students.

Characteristics:

- Daily commuters
 - Frequent cab users
 - Students living off campus
 - Students travelling long distances
-

Secondary Users

Future expansion users.

Examples:

- Students from other universities
 - Student clubs
 - Event organizers
-

6. Stakeholders

Founder

Responsible for:

- Product vision
 - Growth strategy
 - Partnerships
-

Product Team

Responsible for:

- Requirements
- Feature prioritization
- User experience

Development Team

Responsible for:

- Frontend
- Backend
- Deployment
- Infrastructure

Operations Team

Responsible for:

- User moderation
- Issue resolution
- Community management

7. MVP Scope

Version 1 focuses only on the minimum set of features required to validate the business idea.

Included:

✓ Authentication

✓ User Profiles

✓ Ride Creation

✓ Ride Discovery

✓ Notifications

Not Included:

✗ Taxi Pool

✗ Payments

✗ Advanced Matching

X Monetization

X Multi-campus Support

8. Authentication Module

Objective

Ensure only verified Atlas students can access the platform.

Features

Student Registration

Users can register using:

- Email
 - Phone Number
-

Student Verification

Only approved students should gain access.

Login

Registered users should be able to securely access the application.

Password Recovery

Users should be able to recover access to their account.

9. Profile Management Module

Every student should maintain a profile containing:

- Name
- Program

- Year
- Profile Photo
- Contact Information

Profiles help create trust within the platform.

Trust is considered one of the most important success factors for PullUp.

10. Ride Creation Module

Users should be able to create ride requests.

Each ride request should contain:

- Pickup Location
- Destination
- Departure Time
- Additional Notes

The system should store ride requests for future discovery.

11. Ride Discovery Module

Users should be able to browse available rides.

Discovery should support:

- Destination filtering
- Time filtering
- Date filtering

The objective is to help students identify transportation opportunities.

12. Notification Module

Users should receive notifications when:

- New rides become available
- Ride requests match user interests
- Profile updates occur
- System announcements are issued

Push notifications are expected to be handled through Firebase Cloud Messaging.

13. Technology Assumptions

Frontend: React Native

Backend: Firebase

Database: Firestore

Authentication: Firebase Authentication

Notifications: Firebase Cloud Messaging

Maps: Google Maps API

These technologies were selected to enable rapid development and lower operational costs during the MVP stage.

14. Risks & Assumptions

Risk 1: Low student adoption.

Risk 2: Insufficient ride density.

Risk 3: Technical dependency on a single developer.

Risk 4: Improper Firebase architecture causing scaling issues.

Risk 5: Poor matching quality leading to low retention.

15. Success Metrics

The MVP will be considered successful if:

- Students actively create rides.
- Students discover relevant rides.
- Daily engagement remains consistent.
- Transportation costs are reduced for users.
- Positive campus adoption is observed.

16. Future Considerations

The following features have intentionally been postponed to future versions:

- Taxi Pool
- Fare Splitting
- Sponsored Listings
- Analytics Dashboard
- Campus Expansion
- Smart Matching
- AI Recommendations
- Monetization Systems

These features may be revisited after initial user validation.

Document Approval

Status: Approved for Development Planning

Version: 1.0

Date: April 2026

Project: PullUp
